

Outline - Global Source Radiator

The Globe Source Radiator is an innovative omnidirectional loudspeaker for acoustical measurements. A companion matching four-channel 500W/channel power amplifier with built-in noise source and wireless remote control is also available. The nominal sound power level is 125dB with the miniaturized matching Outline power amplifier and has less than 0.3dB power compression, but the source can deliver up to 130dB with a more powerful power amplifier with the same power compression. The GSR and Outline miniaturized power amplifier can be configured to power selected drivers to obtain different radiation patterns, useful for approximating musical instrument sources. An optional powered subwoofer extends the response to 40Hz.
